Grown from real soil data

Sensors in the field measure moisture, temperature and humidity every few minutes — no guesswork, just readings.

Irrigate only when needed

An advisory blends soil moisture with the local rain outlook, so water goes to the crop, not the drain.

Built for the smallholder

Low-cost hardware, regional languages, and crop suggestions tuned to your field's climate.

SOIL MOISTURE

HUMIDITY

71%

37 min ago

Hold off irrigating. Soil is dry, but ~15mm rain is expected in the next 2 days.

Reading frequency

Set how often the field node takes and sends a reading.

☁ 6.3mm

Suggested crops for this climate

Rule-of-thumb match — not a substitute for local agri-extension advice.

Rice (Paddy)

Warm with good rainfall

Sugarcane

High humidity, warm climate

Turmeric/Ginger

Thrives with regular rainfall

7-day trend

Soil moisture and temperature over recent readings.

Why soil moisture data matters

Over-watering wastes diesel, electricity and groundwater; under-watering stresses the crop right when yield is decided. A few percentage points of soil moisture, tracked over time, tell a far more honest story than a daily glance at the topsoil.

- **Root-zone timing.** Moisture trends show when water has actually reached the root zone, not just the surface.
- **Rain-aware irrigation.** Pairing sensor data with the 5-day outlook avoids irrigating right before a forecast downpour.
- **Season-over-season learning.** Logged readings build a record you can compare across sowing seasons.

From the field

A glimpse of the everyday work this data supports — sowing, watching, and harvesting by the numbers.
